Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

N.Alternate names: trypsin inhibitor (Kunitz-type)
C;Species: Eristocophis macmahoni (leaf-nosed viper)
C;Abccies: Eristocophis macmahoni (leaf-nosed viper)
C;Abcciesion: S19327

delaying its inactivation during signal transduction. Thus it strongly stimulates mammalian cardiac muscle contraction.
--- SUBCELLULAR LOCATION: Secreted; cnidocyst.
--- MISCELLANEOUS: Anthopleurin B is the most potent peptide heart stimulator isolated from the sea anemone.
---- SIMILARITY: Belongs to the sea anemone sodium channel inhibitory toxin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-MAR-1992 (Rel. 21, Created)

-!- FUNCTION: Stimulates prolactin (PRL) release and regulates the expression of prolactin through its receptor GPR10. May stimulate lactotrophs directly to secrete PRL.

-!- TISSUE SPECIFICITY: Medulla oblongata and hypothalamus.

Mallya M., Campbell R.D., Aguado B.;
"Transcriptional analysis of a novel cluster of LY-6 family members in the buman and mouse major histocompatibility complex: five genes with many splice forms.";
                     FUNCTION: Facilitative glucose transporter. This isoform likely mediates the bidirectional transfer of glucose across the plasma membrane of hepatocytes and is responsible for uptake of glucose by the beta cells; may comprise part of the glucose-sensing mechanism of the beta cell; may also participate with the Na(+)/Glucose cotransporter in the transcellular transport of glucose in the small intestine and kidney (By similarity). SIMELLARIAR LOCATION: Integral membrane protein.

SIMILARITY: Belongs to the sugar transporter family. Glucose transporter subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16-OCT-2001 (Rel. 40, Created)

                      sites (By similarity).
-!- SUBUNIT: Part of the 30S ribosomal subunit. Forms a loose heteroidiner with protein S19. Forms two bridges to the 50S subunit in the 70S ribosome (By similarity).
-!- SIMILARITY: Belongs to the S13P family of ribosomal proteins.
implicated in subunit movement. Contacts the tRNAs in the A and P-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-074/1990 (Rel. 13, Created)

Theidence for lateral gene transfer between Archaea and Bacteria from genome sequence of Thermotoga maritima.";

Thymorrows sequence of Thermotoga maritima.";

Nature 399:323-229(1999)

C. - FUNCTION: Located at the top of the head of the 30S subunit, it contacts several helices of the 16S rRNA. In the 70S ribosome it contacts the 23S rRNA (bridge Bla) and protein L5 of the 50S subunit (bridge Blb), connecting the 2 subunits; these bridges are

"Unique physiological and pathogenic features of Leptospira
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           interrogan revealed by whole-genome sequencing.";
Nature 422:888-893(2003).
-!- CAPALYTIC ACTIVITY: Protein L-methionine + oxidized thioredoxin protein L-methionine S-oxide + reduced thioredoxin.
-!- SIMILARITY: Belongs to the msrB Met sulfoxide reductase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Leptospira interrogans.

Biophys. Acta 1132:72-74(1992).
-!- FUNCTION: Potent stimulator of insulin secretion and relatively por inhibitor of gastric acid secretion.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Highly expressed in the duodenum and jejunum.
-!- SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE FROM N.A.

T (GIP) cDNA from a tumor cell line (STG6-14) and quantification of

T Glucose-induced increases in GIP mRNA.";

T Blochim. Blophys. Act at 1308:111-113 (1996).

C -: FUNCTION: Potent simulator of insulin secretion and relatively

CC -: SUBCELULAR LOCATION: Secreted.

CC -: SUBCELULAR LOCATION: Secreted.

CC -: SIMILARITY: Belongs to the glucagon family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PIR; S71426; S71426.

                                                                                                                                  primarily to the perinuclear region, undergoing continued recycling to the plasma membrane where it is rapidly reinteringlized. The dileucine internalization motif is critical for intracellular sequestration (By similarity).

--- PTM: Sumoylated (By similarity).

Gen. Genet. 217:185-194(1989).

-!- SUBUMIT: Part of the 30s Tibosomal subunit.
-!- SUBCILITAR LOCATION. Chloroplast.
-!- SIMILARITY: Belongs to the S18P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

R. Generation and initial analysis of more than 15,000 full-length

R. Tissub Specificity: Expressed in motive protein (Potential).

C. -- TISSUB SPECIFICITY: Expressed in brain, heart, or

skeletal muscle. Expressed in brain, heart, or

skeletal muscle. Expressed in some TCR alma deta-

clones (both CD4+ and CD8+), but me sort expressing CTL

clones (both CD4+ and CD8+), but is sont expressed in other TCR

alpha beta-expressing CTL clones and in cell lines representing B

c. -- SIMILARITY: Belongs to the PMP-22 / EMP / MP20 family.

-!- FUNCTION: May be involved in hair development.
-!- SUBCELLULAR LOCATION: Secreted (Potential).
-!- SIMILARITY: Belongs to the heparin-binding growth factors family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=22887296; PubMed=12975309; Clark H.F., Gurney A.L., Abaya E., Baker K., Baldwin D., Brush J., Clark H.F., Gurney A.L., Crowley C., Currell B., Douel B., Dowd P., Eaton D., Poster J., Grimaldi C., Gu Q., Hass P.E., Heldens S., Lewis D., Kim H.S., Klimowski L., Jin Y., Johnson S., Lee J., Liao D., Mark M., Robbie E., Sanchez C., Schoenfeld J., Seshagiri S., Simmons L., Singh J., Smith V., Stinson J., Vagts A., Vandlen R., Watanabe C., Wieand D., Woods K., Xie M.-H., Yansura D., Yi S., Yu G., Yuan J., Zhang M., Zhang Z., Goddard A., Wood W.I., Godowski P.;

                         cathelicidins, precursors of antimicrobial peptides.";

Eur. J. Blochem. 238:769-776(1996).

-!- FUNCTION: Exerts, in vitro, a portent antimicrobial activity.

Probably due to an impairment of the function of the respiratory chain and of energy-dependent activities in the inner membrane of susceptible microorganisms.

-!- TISSUE SPECIFICITY: Large granules of neutrophils.

-!- PTM: Blastase is responsible for its maturation.

-!- PTM: Blastase is responsible for its maturation.

-!- SUBONIT: The APC is composed of at least 11 subunits (By
similarity).
-!- SIMILARITY: Belongs to the APC10 family.

-!- TISSUE SPECIFICITY: In the embryo, expressed primarily in the developing nervous system with strong expression in the dorsal root ganglia and gonads. Ubiquitously expressed in the adult.
-!- DEVELOPMENTAL STAGE: Expression is detected from embryonic day 7 and continues throughout development and into adulthood.
-!- SIMILARITY: Contains 1 RING-type zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=20408957; PubMed=10849425; Lyngsoe C., Bouteiller G., Damgaard C.K., Ryom D., Sanchez-Munoz S., Noerby P.L., Bonven B.J., Josegensen P.; Interaction between the transcription factor SPBP and the positive cofactor RNF4. An interplay between protein binding zinc fingers."; J. Blol. Chem. 275:26144-26149 (2000).

-1- FUNCTION: Enhances steroid teceptor-mediated transcriptional activation as well as activating basal transcription (By
